

The Longevity Lift Library

10 Exercises to Stay Strong, Capable, and Independent for Life

Built by a Physical Therapist. Designed for real life.

This library isn't about maxing out or chasing PRs. It's about maintaining strength, mobility, and confidence so you can:

- Get off the floor
- Carry groceries
- Climb stairs
- Travel, train, and live independently well into older age

How to Use This Library

- Train these 2–4x per week
- Use loads you can control with good form
- Aim for **2–4 sets of 6–12 reps** (unless otherwise noted)
- Focus on slow, controlled reps

You don't need all 10 in every workout. Think of this as a **menu**, not a prescription.

1. Squat (Goblet, Front, or Back)

Why it matters: Getting out of a chair and off the toilet.

Trains: Quads, glutes, core

Longevity Tip: Goblet squats are often the most joint-friendly starting point.

2. Deadlift (Trap Bar, Kettlebell, or Barbell)

Why it matters: Picking things up safely from the floor.

Trains: Glutes, hamstrings, back

Longevity Tip: Trap bar and kettlebell deadlifts are more spine-friendly if your back is prone to irritation.

3. Forward or Reverse Lunge

Why it matters: Walking, hiking, stair climbing, and balance.

Trains: Single-leg strength, hip stability

Longevity Tip: Reverse lunges are often easier on the knees.

4. Lateral Lunge

Why it matters: Side-to-side movements are important to train to keep your body resilient to the different stresses life throws at it.

Trains: Adductors, glutes, hip mobility

Longevity Tip: Keep this slow and controlled, and ensure that your knee stays in line with your 2nd and 3rd toes (no knee caving in)

5. Push-Up or Bench Press

Why it matters: Pushing yourself up from the floor or a chair.

Trains: Chest, shoulders, triceps

Longevity Tip: Maintain control through your full range of motion. Don't just let the bar bounce off your chest.

6. Overhead Press (Dumbbell or Barbell)

Why it matters: Reaching overhead—putting luggage away, grabbing objects.

Trains: Shoulders, upper back, core

Longevity Tip: Dumbbells are a great option to mitigate muscle imbalances.

7. Pull-Up or Lat Pulldown

Why it matters: Upper-body pulling strength supports shoulder and back health (the Lats originate in the lower back).

Trains: Lats, biceps

Longevity Tip: Assisted pull-ups or pulldowns count just as much.

8. Row (Cable, Dumbbell, or Barbell)

Why it matters: Strengthens the upper back muscles that play a big role in maintaining an upright posture.

Trains: Upper back, biceps

Longevity Tip: Prioritize a full range of motion over heavy weight.

9. Hip Thrust or Glute Bridge

Why it matters: Strong glutes protect your back

Trains: Glutes, posterior chain

Longevity Tip: Focus on keeping your spine in a neutral position and moving your hips and ribs as a unit.

10. Unilateral Carry (Suitcase or Farmer Carry)

Why it matters: Carrying groceries, luggage, or kids.

Trains: Core, grip

Longevity Tip: Walk tall and slow—no rushing.

Prescription: 40-60 seconds per side

The Big Picture

You don't need fancy exercises to age well.

You need:

- Strength
- Balance
- Mobility
- Consistency

Train these movements. Protect your joints. Stay active—for life.
